What are Business Connectivity Services?

Introducing the Microsoft Business Connectivity Services

Business Connectivity Services can provide access to external data and services on SharePoint, Office, Exchange, and Visual Studio. The typical solution involves two steps: design and deployment. Use the Business Connectivity Services Wizards to create external data sources and publish external data sources. You can also use third-party services, such as Commerce Services, to test the new solution. Analyze the solution in the Business Connectivity Services Designer, and then deploy it to SharePoint and Office applications.
